10, 10 , 80 or  
20, 10 , 80

# Enhancement Controls

# Enhancements

**Benefit:** Greatest accuracy for high-speed, low-power engraving

Three settings:

- 1. Contrast:** Optimizes laser pulsing for middle of text
- 2. Definition:** Optimizes ascenders & descenders (#1 & #2 above add pulse stimulation for bolder result)
- 3. Density:** reduces stimulation everywhere to make characters thinner if needed

gjkb

When to Use:

- Small features at high speed and low power on materials like anodized aluminum, coated brass, acrylic, plastics
- Do NOT use on photographs
- Not needed at high power (90 – 100%)

# Enhancements

1. Contrast – increase to add laser stimulation in concentrated areas (middle)

**Universal Laser Systems, Inc.**

2. Definition – increase to add laser stimulation to ascenders and descenders

**Universal Laser Systems, Inc.**

3. Density – decrease to reduce laser stimulation and reduce overall boldness

**Universal Laser Systems, Inc.**

UNIVERSAL  
SYSTEMS, INC.

# Enhancement Example

## IMAGE ENHANCEMENT

ANODIZED ALUMINUM 6 POINT FONT, TIMES NEW ROMAN

**MAGNIFIED 15X**

**RUN ON A 50 WATT AT 100 % SPEED!**

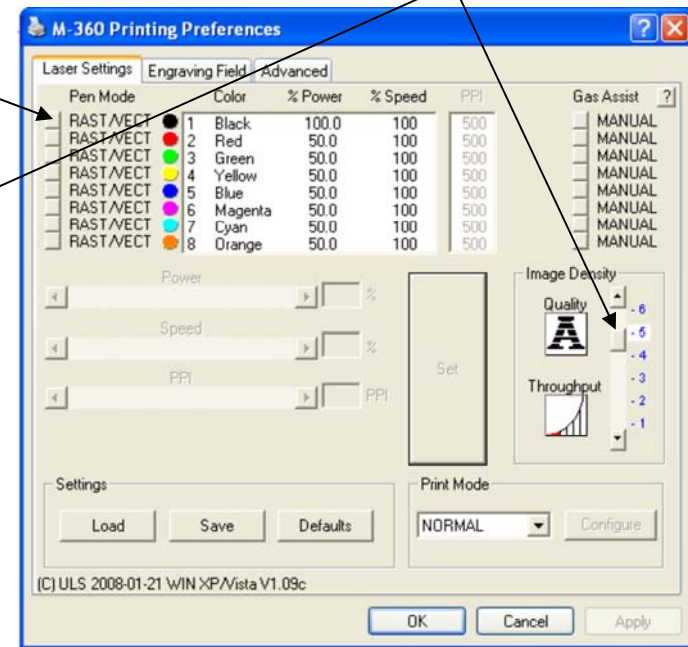

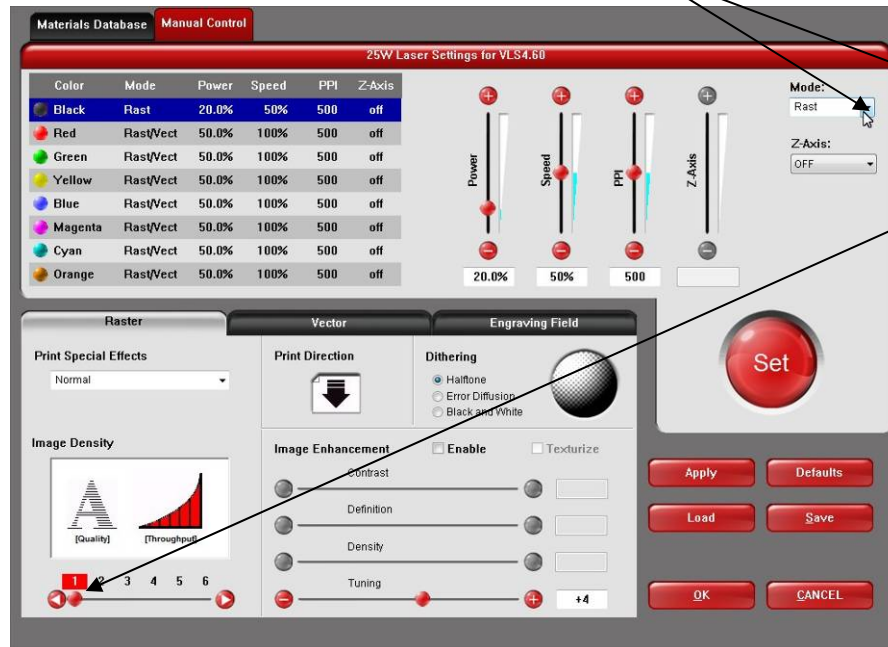

# Tuning your Laser

- Draw some black vertical lines in your drawing program, print job to laser
- Force the engraving to "Rast" or Raster only and engrave at Image Density 1 or 2

Force "Rast"

Image Density 1 or 2

# Tuning

- Engrave vertical lines (must be raster mode)
- Materials like Plastic or Anodized work best
- Tuning adjusts timing of pulses to motion system
- Adjust value in driver up or down

Example vertical lines sent to laser for raster tuning test

Laser not in tune - dots not aligned during left & right strokes

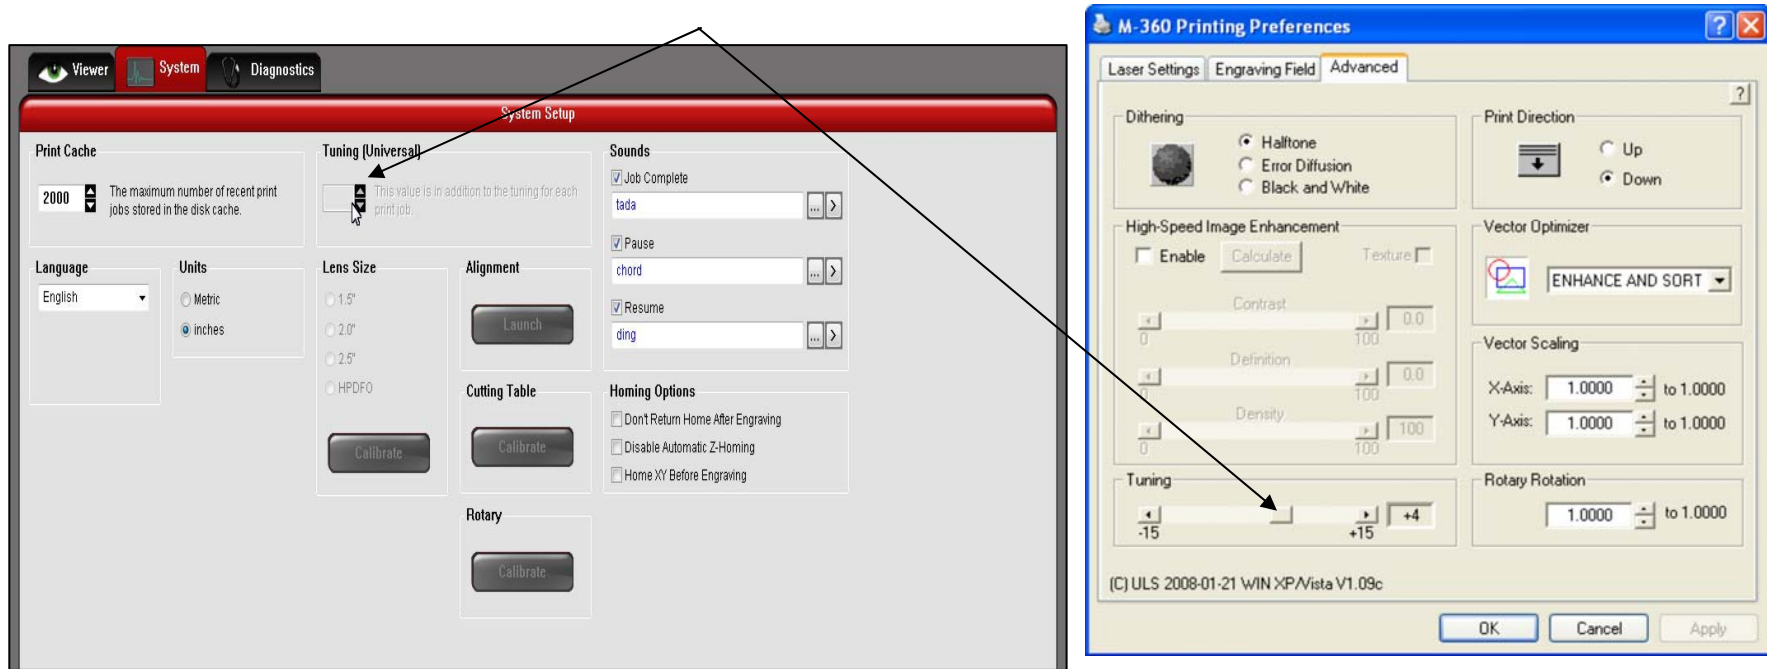

Tuned laser - dots align

- Engrave lines, adjust tuning in the Control Panel until the lines are straight
- Typical tuning values are from +4 to +10

- Control Panel (system Tab) on VLS, PLS and ILS
- Advanced Tab on all other models systems

# Tuning Example Pattern

- Sample engraved at 100% speed Image Density 1
- Top rastered and tuned at +5 (Correct tune)
- Bottom rastered and tuned to -4 (Incorrect tune)

# Tuning Example

- Top Text: Out of Tune
- Bottom Text: In Tune
- 6 Point Font Magnified 15 times
- Engraved on Anodized Aluminum

# Tuning Recap

- Simple procedure, assures quality
- Adjusts laser pulse timing for raster engraving
- Can compensate for belt wear, motion system wear
- Should be checked every 6 months on standard use
- Do not to use the same spot on the work table all the time; the tuning value will then be different on other parts of your engraving field due to belt wear
